Three Main SLAM Paradigms

Kalman filter

Particle filter

Graphbased

least squares approach to SLAM

2

Least Squares in General

- Approach for computing a solution for an overdetermined system
- "More equations than unknowns"
- Minimizes the sum of the squared errors in the equations
- Standard approach to a large set of problems

Least Squares History

- Method developed by Carl Friedrich Gauss in 1795 (he was 18 years old)
- First showcase: predicting the future location of the asteroid Ceres in 1801

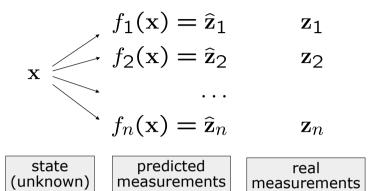

Courtesy: Astronomische Nachrichten, 1828

3

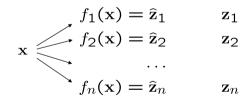

Problem

- Given a system described by a set of n observation functions $\{f_i(\mathbf{x})\}_{i=1:n}$
- Let
 - X be the state vector
 - \mathbf{Z}_i be a measurement of the state \mathbf{X}
 - $\hat{\mathbf{z}}_i = f_i(\mathbf{x})$ be a function which maps \mathbf{x} to a predicted measurement $\hat{\mathbf{z}}_i$
- Given n noisy measurements z_{1:n} about the state x
- Goal: Estimate the state x which bests explains the measurements $z_{1:n}$

Graphical Explanation

Example

- x position of 3D features
- \mathbf{z}_i coordinates of the 3D features projected on camera images
- Estimate the most likely 3D position of the features based on the image projections (given the camera poses)

Error Function

5

7

 Error e_i is typically the difference between the predicted and actual measurement

$$\mathbf{e}_i(\mathbf{x}) = \mathbf{z}_i - f_i(\mathbf{x})$$

- We assume that the error has zero mean and is normally distributed
- ullet Gaussian error with information matrix Ω_i
- The squared error of a measurement depends only on the state and is a scalar

$$e_i(\mathbf{x}) = \mathbf{e}_i(\mathbf{x})^T \mathbf{\Omega}_i \mathbf{e}_i(\mathbf{x})$$

Goal: Find the Minimum

 Find the state x* which minimizes the error given all measurements

$$\begin{aligned} \mathbf{x}^* &= \underset{\mathbf{x}}{\operatorname{argmin}} F(\mathbf{x}) \longleftarrow \underbrace{\text{global error (scalar)}} \\ &= \underset{\mathbf{x}}{\operatorname{argmin}} \sum_i e_i(\mathbf{x}) \leftarrow \underbrace{\text{squared error terms (scalar)}} \\ &= \underset{\mathbf{x}}{\operatorname{argmin}} \sum_i \mathbf{e}_i^T(\mathbf{x}) \Omega_i \mathbf{e}_i(\mathbf{x}) \\ &\stackrel{\uparrow}{\underset{\text{error terms (vector)}}{\underbrace{}}} \end{aligned}$$

9

Goal: Find the Minimum

 Find the state x* which minimizes the error given all measurements

$$\mathbf{x}^* = \underset{\mathbf{x}}{\operatorname{argmin}} \sum_i \mathbf{e}_i^T(\mathbf{x}) \Omega_i \mathbf{e}_i(\mathbf{x})$$

- A general solution is to derive the global error function and find its nulls
- In general complex and no closed form solution
- → Numerical approaches

10

Assumption

- A "good" initial guess is available
- The error functions are "smooth" in the neighborhood of the (hopefully global) minima
- Then, we can solve the problem by iterative local linearizations

Solve Via Iterative Local Linearizations

- Linearize the error terms around the current solution/initial guess
- Compute the first derivative of the squared error function
- Set it to zero and solve linear system
- Obtain the new state (that is hopefully closer to the minimum)
- Iterate

Linearizing the Error Function

 Approximate the error functions around an initial guess x via Taylor expansion

$$\mathrm{e}_i(\mathrm{x} + \Delta \mathrm{x}) \; \simeq \; \underbrace{\mathrm{e}_i(\mathrm{x})}_{\mathrm{e}_i} + \mathrm{J}_i(\mathrm{x}) \Delta \mathrm{x}$$

Reminder: Jacobian

$$\mathbf{J}_{f}(x) = \begin{pmatrix} \frac{\partial f_{1}(x)}{\partial x_{1}} & \frac{\partial f_{1}(x)}{\partial x_{2}} & \cdots & \frac{\partial f_{1}(x)}{\partial x_{n}} \\ \frac{\partial f_{2}(x)}{\partial x_{1}} & \frac{\partial f_{2}(x)}{\partial x_{2}} & \cdots & \frac{\partial f_{2}(x)}{\partial x_{n}} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial f_{m}(x)}{\partial x_{1}} & \frac{\partial f_{m}(x)}{\partial x_{2}} & \cdots & \frac{\partial f_{m}(x)}{\partial x_{n}} \end{pmatrix}$$

13

Squared Error

- With the previous linearization, we can fix x and carry out the minimization in the increments Δx
- We replace the Taylor expansion in the squared error terms:

$$e_{i}(\mathbf{x} + \Delta \mathbf{x}) = \mathbf{e}_{i}^{T}(\mathbf{x} + \Delta \mathbf{x})\Omega_{i}\mathbf{e}_{i}(\mathbf{x} + \Delta \mathbf{x})$$

$$\simeq (\mathbf{e}_{i} + \mathbf{J}_{i}\Delta \mathbf{x})^{T}\Omega_{i}(\mathbf{e}_{i} + \mathbf{J}_{i}\Delta \mathbf{x})$$

$$= \mathbf{e}_{i}^{T}\Omega_{i}\mathbf{e}_{i} +$$

$$\mathbf{e}_{i}^{T}\Omega_{i}\mathbf{J}_{i}\Delta \mathbf{x} + \Delta \mathbf{x}^{T}\mathbf{J}_{i}^{T}\Omega_{i}\mathbf{e}_{i} +$$

$$\Delta \mathbf{x}^{T}\mathbf{J}_{i}^{T}\Omega_{i}\mathbf{J}_{i}\Delta \mathbf{x}$$
₁₅

Squared Error

- With the previous linearization, we can fix x and carry out the minimization in the increments Δx
- We replace the Taylor expansion in the squared error terms:

$$e_i(\mathbf{x} + \Delta \mathbf{x}) = \dots$$

14

Squared Error (cont.)

- All summands are scalar so the transposition has no effect
- By grouping similar terms, we obtain:

$$e_{i}(\mathbf{x} + \Delta \mathbf{x})$$

$$\simeq \mathbf{e}_{i}^{T} \Omega_{i} \mathbf{e}_{i} + \mathbf{e}_{i}^{T} \Omega_{i} \mathbf{J}_{i} \Delta \mathbf{x} + \Delta \mathbf{x}^{T} \mathbf{J}_{i}^{T} \Omega_{i} \mathbf{e}_{i} + \mathbf{\Delta} \mathbf{x}^{T} \mathbf{J}_{i}^{T} \Omega_{i} \mathbf{J}_{i} \Delta \mathbf{x}$$

$$= \underbrace{\mathbf{e}_{i}^{T} \Omega_{i} \mathbf{e}_{i}}_{c_{i}} + 2 \underbrace{\mathbf{e}_{i}^{T} \Omega_{i} \mathbf{J}_{i}}_{\mathbf{b}_{i}^{T}} \Delta \mathbf{x} + \Delta \mathbf{x}^{T} \underbrace{\mathbf{J}_{i}^{T} \Omega_{i} \mathbf{J}_{i}}_{\mathbf{H}_{i}} \Delta \mathbf{x}$$

$$= c_{i} + 2 \mathbf{b}_{i}^{T} \Delta \mathbf{x} + \Delta \mathbf{x}^{T} \mathbf{H}_{i} \Delta \mathbf{x}$$

Global Error

- The global error is the sum of the squared errors terms corresponding to the individual measurements
- Form a new expression which approximates the global error in the neighborhood of the current solution x

$$F(\mathbf{x} + \Delta \mathbf{x}) \simeq \sum_{i} (c_i + \mathbf{b}_i^T \Delta \mathbf{x} + \Delta \mathbf{x}^T \mathbf{H}_i \Delta \mathbf{x})$$
$$= \sum_{i} c_i + 2(\sum_{i} \mathbf{b}_i^T) \Delta \mathbf{x} + \Delta \mathbf{x}^T (\sum_{i} \mathbf{H}_i) \Delta \mathbf{x}$$

17

Global Error (cont.)

$$F(\mathbf{x} + \Delta \mathbf{x}) \simeq \sum_{i} \left(c_{i} + \mathbf{b}_{i}^{T} \Delta \mathbf{x} + \Delta \mathbf{x}^{T} \mathbf{H}_{i} \Delta \mathbf{x} \right)$$

$$= \sum_{i} c_{i} + 2 \left(\sum_{i} \mathbf{b}_{i}^{T} \right) \Delta \mathbf{x} + \Delta \mathbf{x}^{T} \left(\sum_{i} \mathbf{H}_{i} \right) \Delta \mathbf{x}$$

$$= c + 2 \mathbf{b}^{T} \Delta \mathbf{x} + \Delta \mathbf{x}^{T} \mathbf{H} \Delta \mathbf{x}$$

with

$$egin{array}{lll} \mathbf{b}^T &=& \sum_i \mathbf{e}_i^T \mathbf{\Omega}_i \mathbf{J}_i \ \mathbf{H} &=& \sum_i \mathbf{J}_i^T \mathbf{\Omega} \mathbf{J}_i \end{array}$$

18

Quadratic Form

• We can write the global error terms as a quadratic form in $\Delta_{\rm X}$

$$F(\mathbf{x} + \Delta \mathbf{x}) \simeq c + 2\mathbf{b}^T \Delta \mathbf{x} + \Delta \mathbf{x}^T \mathbf{H} \Delta \mathbf{x}$$

• We need to compute the derivative of $F(\mathbf{x} + \Delta \mathbf{x})$ w.r.t. $\Delta \mathbf{x}$ (given \mathbf{x})

Deriving a Quadratic Form

Assume a quadratic form

$$f(\mathbf{x}) = \mathbf{x}^T \mathbf{H} \mathbf{x} + \mathbf{b}^T \mathbf{x}$$

The first derivative is

$$\frac{\partial f}{\partial \mathbf{x}} = (\mathbf{H} + \mathbf{H}^T)\mathbf{x} + \mathbf{b}$$

See: The Matrix Cookbook, Section 2.2.4

Quadratic Form

• We can write the global error terms as a quadratic form in $\Delta_{\mathbf{X}}$

$$F(\mathbf{x} + \Delta \mathbf{x}) \simeq c + 2\mathbf{b}^T \Delta \mathbf{x} + \Delta \mathbf{x}^T \mathbf{H} \Delta \mathbf{x}$$

• The derivative of the approximated $F(\mathbf{x} + \Delta \mathbf{x})$ w.r.t. $\Delta \mathbf{x}$ is then:

$$\frac{\partial F(\mathbf{x} + \Delta \mathbf{x})}{\partial \Delta \mathbf{x}} \simeq 2\mathbf{b} + 2\mathbf{H}\Delta \mathbf{x}$$

21

Minimizing the Quadratic Form

lacktriangle Derivative of $F(\mathbf{x} + \Delta \mathbf{x})$

$$\frac{\partial F(\mathbf{x} + \Delta \mathbf{x})}{\partial \Delta \mathbf{x}} \simeq 2\mathbf{b} + 2\mathbf{H}\Delta \mathbf{x}$$

Setting it to zero leads to

$$0 = 2b + 2H\Delta x$$

Which leads to the linear system

$$H\Delta x = -b$$

• The solution for the increment Δx^* is

$$\Delta \mathbf{x}^* = -\mathbf{H}^{-1}\mathbf{b}$$

22

Gauss-Newton Solution

Iterate the following steps:

 Linearize around x and compute for each measurement

$$e_i(x + \Delta x) \simeq e_i(x) + J_i \Delta x$$

- Compute the terms for the linear system $\mathbf{b}^T = \sum_i \mathbf{e}_i^T \Omega_i \mathbf{J}_i \qquad \mathbf{H} = \sum_i \mathbf{J}_i^T \Omega_i \mathbf{J}_i$
- Solve the linear system

$$\Delta \mathbf{x}^* = -\mathbf{H}^{-1}\mathbf{b}$$

• Updating state $x \leftarrow x + \Delta x^*$

Example: Odometry Calibration

- Odometry measurements \mathbf{u}_i
- Eliminate systematic error through calibration
- Assumption: Ground truth odometry \mathbf{u}_i^* is available
- Ground truth by motion capture, scanmatching, or a SLAM system

Example: Odometry Calibration

• There is a function $f_i(\mathbf{x})$ which, given some bias parameters \mathbf{x} , returns a an unbiased (corrected) odometry for the reading \mathbf{u}_i' as follows

$$\mathbf{u}_{i}' = f_{i}(\mathbf{x}) = \begin{pmatrix} x_{11} & x_{12} & x_{13} \\ x_{21} & x_{22} & x_{23} \\ x_{31} & x_{32} & x_{33} \end{pmatrix} \mathbf{u}_{i}$$

 ${\color{red} \bullet}$ To obtain the correction function $f(\mathbf{x})$, we need to find the parameters \mathbf{x}

Odometry Calibration (cont.)

- The state vector is $\mathbf{x} = \begin{pmatrix} x_{11} & x_{12} & x_{13} & x_{21} & x_{22} & x_{23} & x_{31} & x_{32} & x_{33} \end{pmatrix}^T$
- The error function is

$$\mathbf{e}_{i}(\mathbf{x}) = \mathbf{u}_{i}^{*} - \begin{pmatrix} x_{11} & x_{12} & x_{13} \\ x_{21} & x_{22} & x_{23} \\ x_{31} & x_{32} & x_{33} \end{pmatrix} \mathbf{u}_{i}$$

• Its derivative is:

$$\mathbf{J}_i = \frac{\partial \mathbf{e}_i(\mathbf{x})}{\partial \mathbf{x}} = - \begin{pmatrix} u_{i,x} & u_{i,y} & u_{i,\theta} \\ & & u_{i,x} & u_{i,y} & u_{i,\theta} \\ & & & u_{i,x} & u_{i,y} & u_{i,\theta} \end{pmatrix}$$
s not depend on \mathbf{x} , why? What are the consequences?

Questions

- How do the parameters look like if the odometry is perfect?
- How many measurements (at least) are needed to find a solution for the calibration problem?
- H is symmetric. Why?
- How does the structure of the measurement function affects the structure of H?

How to Efficiently Solve the Linear System?

- Linear system $H\Delta x = -b$
- Can be solved by matrix inversion (in theory)
- In practice:
 - Cholesky factorization
 - QR decomposition
 - Iterative methods such as conjugate gradients (for large systems)

Cholesky Decomposition for Solving a Linear System

- A symmetric and positive definite
- System to solve Ax = b
- Cholesky leads to $A = LL^T$ with L being a lower triangular matrix
- Solve first

$$Ly = b$$

an then

$$\mathbf{L}^T \mathbf{x} = \mathbf{y}$$

Method to minimize a squared error:

Gauss-Newton Summary

- Start with an initial guess
- Linearize the individual error functions
- This leads to a quadratic form
- One obtains a linear system by settings its derivative to zero
- Solving the linear systems leads to a state update
- Iterate

30

Relation to Probabilistic State Estimation

- So far, we minimized an error function
- How does this relate to state estimation in the probabilistic sense?

General State Estimation

 Bayes rule, independence and Markov assumptions allow us to write

$$p(x_{0:t} \mid z_{1:t}, u_{1:t}) = \eta p(x_0) \prod_{t} [p(x_t \mid x_{t-1}, u_t) p(z_t \mid x_t)]$$

Log Likelihood

Written as the log likelihood, leads to

$$\log p(x_{0:t} \mid z_{1:t}, u_{1:t})$$
= const. + log $p(x_0)$
+ $\sum_{t} [\log p(x_t \mid x_{t-1}, u_t) + \log p(z_t \mid x_t)]$

33

Log of a Gaussian

Log likelihood of a Gaussian

$$\log \mathcal{N}(x, \mu, \Sigma)$$
= const. $-\frac{1}{2}(x - \mu)^T \Sigma^{-1}(x - \mu)$

Gaussian Assumption

Assuming Gaussian distributions

$$\log p(x_{0:t} \mid z_{1:t}, u_{1:t})$$

$$= \text{const.} + \log \underbrace{p(x_0)}_{\mathcal{N}}$$

$$+ \sum_{t} \left[\log \underbrace{p(x_t \mid x_{t-1}, u_t)}_{\mathcal{N}} + \log \underbrace{p(z_t \mid x_t)}_{\mathcal{N}} \right]$$

34

Error Function as Exponent

Log likelihood of a Gaussian

$$\log \mathcal{N}(x, \mu, \Sigma) = \text{const.} - \frac{1}{2} \underbrace{(x - \mu)^T \sum_{\Omega}^{-1} \underbrace{(x - \mu)}_{\mathbf{e}(x)}}_{e(x)}$$

 is up to a constant equivalent to the error functions used before

Log Likelihood with Error Terms

Assuming Gaussian distributions

$$\log p(x_{0:t} \mid z_{1:t}, u_{1:t})$$

$$= \text{const.} -\frac{1}{2}e_p(x) - \frac{1}{2}\sum_{t} \left[e_{u_t}(x) + e_{z_t}(x)\right]$$

37

Minimizing the Squared Error is Equivalent to Maximizing the Log Likelihood of Independent Gaussian Distributions

with individual error terms for the motions, measurements, and prior:

$$\operatorname{argmax} \log p(x_{0:t} \mid z_{1:t}, u_{1:t})$$

$$= \operatorname{argmin} e_p(x) + \sum_{t} [e_{u_t}(x) + e_{z_t}(x)]$$

Maximizing the Log Likelihood

Assuming Gaussian distributions

$$\log p(x_{0:t} \mid z_{1:t}, u_{1:t})$$

$$= \text{const.} -\frac{1}{2}e_p(x) - \frac{1}{2} \sum_{t} \left[e_{u_t}(x) + e_{z_t}(x) \right]$$

Maximizing the log likelihood leads to

$$\operatorname{argmax} \log p(x_{0:t} \mid z_{1:t}, u_{1:t})$$

$$= \operatorname{argmin} e_p(x) + \sum_{t} \left[e_{u_t}(x) + e_{z_t}(x) \right]$$

38

Summary

- Technique to minimize squared error functions
- Gauss-Newton is an iterative approach for non-linear problems
- Uses linearization (approximation!)
- Equivalent to maximizing the log likelihood of independent Gaussians
- Popular method in a lot of disciplines

Literature

Least Squares and Gauss-Newton
